Fall 2006
EE 490

Introduction

Five screws were used to mount the house to the base. These screws are located at the edges surrounding the house.

There are two connectors that need to be disconnected if the house were to be removed from the base. The two connectors are for signal and power wires and are located directly beneath the house.

All the wires coming directly out of the servos are stranded wire. We then manually soldered solid wires to all of the stranded wire in order to make it easier to solder to the connectors. Hot glue was used to organize and hold down all wires throughout the house. All wires pertaining to each servo (power, ground, and signal) or light bulb (power and signal) were glued in separate groups to the bottom of the house.

Front Door

The front door is opened and closed by means of a servo motor. A hole was drilled through the floor behind the front door so that only the arm would be protruding through the hole. The servo was then mounted to the bottom of the house with hot glue. In order to attach the servo to the front door, small pieces of wood were used to create two pivot points. This allowed for the servo to open the door.

Blinds

There are two pieces of fishing line that are woven through each side of the blinds. One end of each fishing line is connected to a third piece, which is then fed through eyehooks and connects to the servo arm. This allows the servo to pull the blinds vertically. A small metal bar was sewn into the bottom of the fabric to aid gravity in the closing of the blinds.

Ghost

The ghost is also done by means of a servo. In order to get 360° of rotation, the stop was removed from the servo and the correct duty cycle was used. A piece of wood was attached to the servo arm to lengthen the path of the ghost. One end of the wire was then attached to the piece of wood and the other to a foam ball inside the ghost.

Spinning Head

The stop was also removed from this servo to get full rotation. The servo was hot glued to the back of the figurine, and the head was hot glued onto the servo arm.

Carousel

The servo for this action is mounted to the roof of the floor below with only the arm protruding through the floor. The stop was also removed on this servo and the carousel is hot glued to the servo arm.

Piano

The mechanics of the piano are identical to the front door, except that the servo is mounted inside the piano.

Little Girl

The girl is resting on a 45° table with the servo hot glued behind her. One pivot point was made on the back of her head to allow for movement.

Lights

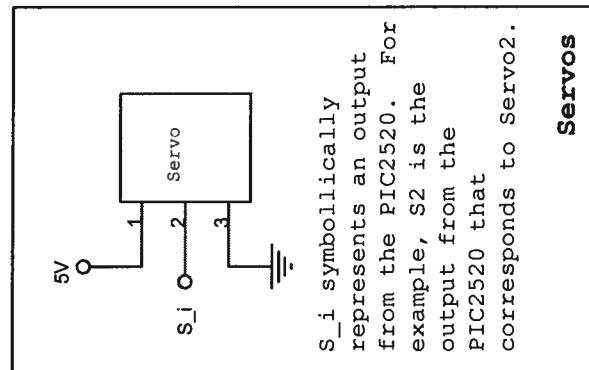

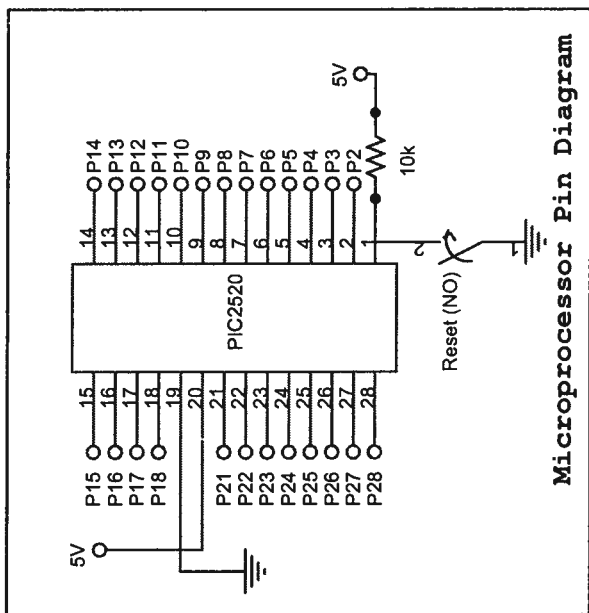

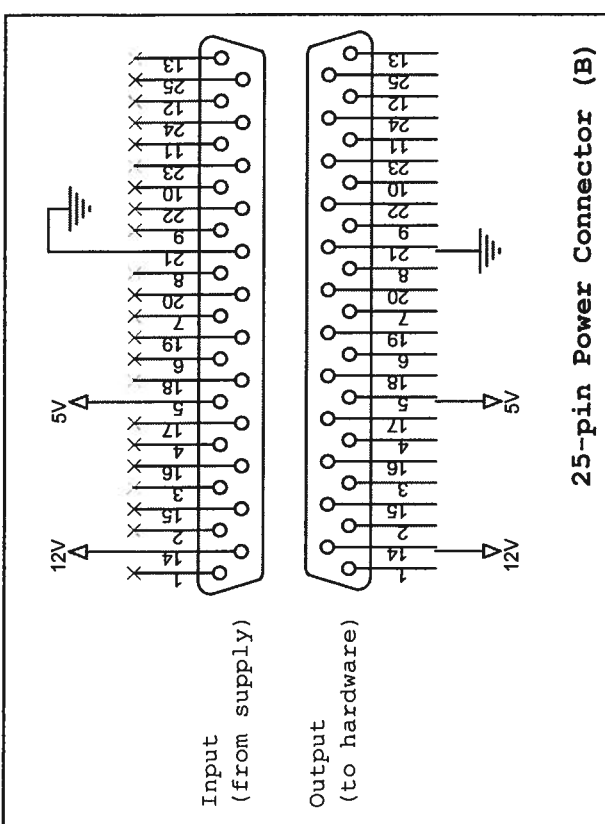

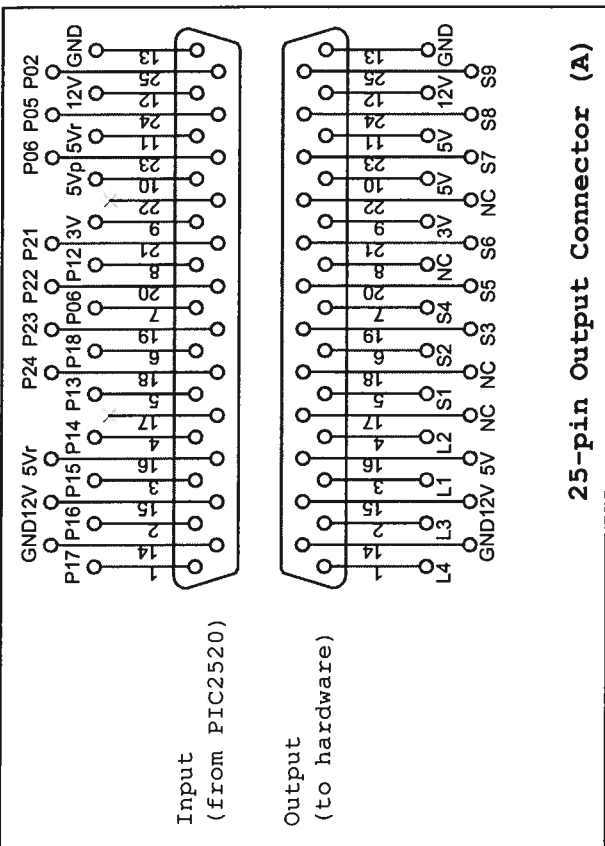

There is one light in every room except for the Halloween room. Three lights were used here because of the darkness of the room. All lights are protruding through the wallpaper and are hot glued to the ceiling.

Pin	Port	Action	Hardware	Manufacturer	Output	Notes
1					no	
2	RA0	Blinds - Butcher Room	Servo	Hi-Tech HS-322HD	yes	
3	RA1	Stop Button	Audio Card		yes	noisy
4	RA2	Back Button	Audio Card		yes	noisy
